Incorporated in 1972, K-Rain® Manufacturing started on the path to become one of the largest manufacturers of irrigation rotors, sprays, valves and controllers in the world.

The Early Years

As a young man, Carl Kah excelled in physics and chemistry and had a keen interest in electronics and aerodynamic design. While still in high school, he designed and built an early version of a cyclone vacuum cleaner. It would be the first of many inventions to come.

From Rockets to Rotors

With a degree in Chemical Engineering and after graduating first in his class from the U.S. Army Artillery Corps Guided Missile School, Carl began work in the Applied Research and Propulsion Division of Pratt & Whitney. His contribution there helped develop the early reusable rocket engines – a technology that is still used by NASA today.

In the evenings, out of concern for his own residential lawn, he used a lathe in his garage to design and machine a valve that cycled from zone to zone thus eliminating the need for multiple valves. Carl patented the valve in 1966.

In 1970, he invented and patented the Modulated Pressure Control. This allowed for the control of the entire irrigation system of a golf course without wires or tubes. The patent was later sold to a manufacturer of golf course irrigation systems. That patent sale was the catalyst to founding K-Rain® Manufacturing.

Expansion

Twelve years later in 1986, Chip Kah joined the business and led the development and growth of indexing valves for the wastewater disposal industry. And as early as 1991, K-Rain® introduced its first gear drive sprinkler. By 1993, Chip would be at the helm as president of the company.

1995 was a new turning point for the company. K-Rain® began expanded their products to retail and Carl's two daughters, Gretchen and Deborah Kah joined the business. Gretchen Kah would eventually lead the west coast sales division. Deborah Kah, an attorney, would be managing intellectual property and human resources.

Christopher Kah, Chip's oldest son, joined the business in 2016 and as recently as 2017 son Trevor officially came on board making it three generations driving the company.

Engineering First

K-Rain® has always been an "engineering first" environment, continually seeking to pair ease-of-use with industry-leading technology. The commitment to quality has led the company to an ISO9001 quality certification in 2006. ISO is the quality standard for manufacturing and process control.

Carl himself holds over 80 patents specific to the irrigation industry including the three-spring reversing mechanism still used today in most gear driven sprinklers. He continues to use his engineering expertise and creativity to further develop innovative technology.

Sustainability is one of the top priorities at the company with a full range of products for reclaimed/recycled water. "Doing our part for a greener future is just part of our DNA," says Adrian Toribio, Director of Operations and Quality. "We're environmentally conscious about the materials we select and ensuring our manufacturing processes are highly energy efficient as well."

K-Rain® persists in leading the industry globally with new developments in rotor and nozzle engineering. "Our RPS™ 75i with Intelligent Flow Technology® is the only rotor of its type to significantly reduce water waste by regulating flow and distance proportionately and simultaneously," notes Chip. "Also, the RPS™ Select is another unique rotor with 4 built-in nozzles—select the pattern and select the equivalent nozzle for matched precipitation. And in the past few years, we've introduced new items such as blue tooth controllers for use with smart phones and WiFi enabled controllers."

Today

Over 400 men and women make up the K-Rain® team, serving customers in the United States and more than 60 countries worldwide. Beyond any technical advancement, people are at the heart of all we do. Every day we go to work with one thought: Make it better.

Flow Through

The unique tilted diaphragm creates a better flow path than traditional globe style electric valves by decreasing friction loss and increasing flow rate.

Manual Flow Control

Precisely adjust flow to the zone. Removable handle prevents tampering.

Self-Cleaning Screen

The straight flow path allows debris to move through and the water path flow cleans the diaphragm filter screen. This provides long life in applications using well or lake water.

Captured Plunger Solenoid

Easy removal when servicing without losing internal parts. Epoxy encapsulated solenoid design ensures longevity unlike the competition's overmolded solenoid.

Resistance and Valve Wire Sizing

Resistance Method

REQUIRED INFORMATION

- Actual one-way length of wire between the controllers and at the power source of the controllers and valves
- Allowable voltage loss along the wire circuit
- Accumulative current flowing through the wire section being sized in amperes

RESISTANCE IS CALCULATED USING FORMULA:

$$R = \frac{1000 \times AVL}{2L \times I}$$

R = Maximum Allowable Resistance of wire in ohms per 1000 feet

AVL = Allowable voltage loss

L = Wire length (one way)

I = Inrush current

AVL for controller power wire sizing is calculated by subtracting minimum operating voltage required by the controller from minimum available voltage at power source. AVL for valve wire sizing is calculated by subtracting minimum solenoid operating voltage from controller output voltage. This number will vary depending on the manufacturer and in some cases with line pressure.

Valve Wire Sizing Example:

Given: Distance from the controller to the valve is 1800 ft. Controller output is 24V. The valve has a minimum operating voltage of 20V and an inrush current of 370 mA (0.37Amps).

$$R = \frac{1000 \times 4}{2(1800) \times 0.37} \quad R = \frac{4000}{332} \quad R = 3.00 \text{ ohms/1000 feet}$$

Wire resistance can not exceed 3.00 ohms per 1000 feet. Go to table #1 and select the proper wire size. Since 16 gauge wire has more resistance than 3.00 ohms per 1000 feet, choose 14 gauge wire. Table 2 is a quick reference and is set up to provide maximum wire runs given the information at the bottom of the table.

Velocity of flow rate values are computed from the general equation $V = .408 Q/d^2$

Friction pressure loss values are computed from the equation $[hf = 0.2083 (100/C) 1.852 Q^{1.852}/d^{4.868}] \times .433$ for psi loss per 100' of pipe.
